

# AMINOSALICYLATES

Dear @Name@,

Your healthcare team has discussed the following medication with you: aminosaliclates. Here is some additional information. Let us know if you have any questions regarding this information.

- This medication belongs to a class of drugs called aminosaliclates, which are also known as 5-ASAs. It helps to reduce the irritation and swelling (inflammation) in the lining of the intestines.
- If taken as prescribed, these medications can work in as quickly as 2 to 4 weeks.
- The benefit of taking this medication is that it is generally well-tolerated and has not been associated with an increased risk for infection or cancer. However, in some cases, it may cause headache, nausea, abdominal pain and cramping, loss of appetite, vomiting, rash, fever, hair loss, or diarrhea. It is rare that this medication causes injury to your pancreas or kidneys. However, those with kidney problems should talk with their healthcare team before using this medication. Your health care provider will be monitoring your kidney function annually.
- If you have unpleasant side effects or you continue to have symptoms, speak to your healthcare team immediately.
- Before taking this medication, let your healthcare team know about other medical conditions that you may have or other medications (even over-the-counter medications or alternative therapies) you may be taking.
- The best way to control your disease is by taking your medication as directed. Even when you do not have any symptoms, it is very important to continue taking your medication to prevent your disease from becoming active again. Do not alter the amount of the medication or how frequently you take it without speaking to your doctor first.
